Rocks From Space Meteorites Meteorite

What is a Lunar Meteorite? Lunar meteorites, or lunaites, are meteorites from the Moon. In other words, they are rocks found on Earth that were ejected from the Moon by the impact of an asteroidal meteoroid or possibly a comet.

Lunar Meteorites

A meteorite is a fragment of rock or iron from outer space, usually a meteoroid or asteroid, which survives passage through the atmosphere as a meteor to impact the surface of the Earth. Meteorites are believed to originate in the asteroid belt between the planets of Mars and Jupiter. A meteorite may range in size from less than a gram to more than 60 tons.

Meteorite: Learn About Meteorites, Meteors & Meteorites ...

Meteorite Blog : Geoff Notkin, co-host of Science Channel's award-winning adventure series Meteorite Men is also a science writer and blogger. His popular meteorite blog features articles on meteorite science, expeditions, history, as well as excellent photography.

Meteorite Information | Learn About Meteorites, Meteorite ...

Density. Unusual density is one of meteorites' more characteristic features. It's not enough to say your rock is heavy. Density is how heavy a rock is for its size or compared with other rocks. Iron meteorites are 3.5 times as heavy as ordinary Earth rocks of the same size, while stony meteorites are about 1.5 times as heavy.

Meteorite Museum - University of New Mexico

What is a Meteorite & where do they come from? Firstly, let's get some terminology out of the way. There is also a full 'Glossary of Meteorite Terms & Definitions' to help. Meteoroid - is a small piece of dust, rock, ice or metal moving through space. They are at least the size of a speck of dust but smaller than an asteroid.

What Is A Meteorite? (Information & Education ...

Meteorite Identification: The Magnet Test. Meteorites are divided into three basic groups: irons, stones, and stony-irons. Practically all meteorites contain a significant amount of extraterrestrial iron and nickel, so the first step in identifying a possible meteorite is the magnet test.

Meteorite Identification: Have you found a space rock?

About 95% of all meteorites contain iron-nickel (FeNi) metal. "Iron-nickel" means that the metal is mostly iron but it contains 4-30% nickel as well as a few tenths of a percent cobalt. Iron-nickel metal in meteorites also has high concentrations (by terrestrial standards) of rare metals like gold, platinum, and iridium.

Metal, Iron, & Nickel - Meteorite Information

Martian Meteorite This meteorite, a basalt lava rock nearly indistinguishable from many Earth rocks, provided the first strong proof that meteorites could come from Mars.

Meteoroids and Meteorites - Solar System

Thousands of meteorites weighing about a pound are thought to fall to Earth every year, but many of these events go unnoticed, because the small rocks land in uninhabited forests or open ocean waters.

How Often do Meteorites Hit the Earth? | Space

A meteorite is a solid piece of debris from an object, such as a comet, asteroid, or meteoroid, that originates in outer space and survives its passage through the atmosphere to reach the surface of a planet or moon. When the object enters the atmosphere, various factors such as friction, pressure, and chemical interactions with the atmospheric gases cause it to heat up and radiate that energy.

Meteorite - Wikipedia

Meteorites from Mars have fallen to Earth over the ages. See photos of these rare Martian space rocks in this SPACE.com gallery.

Meteorites from Mars in Photos | Mars Photos | Space

Welcome to the first edition of Meteorwritings. I am a science writer, photographer, and professional meteorite hunter. I travel the world looking for actual rocks from outer space, and I write about my adventures for both scientific and popular magazines. I have also made documentaries about ...

Meteorite Pictures, Information & Articles by Geoffrey Notkin

Impact Melt - these meteorites have formed from material that was liquefied or partially liquefied from the extreme pressure and heat generated by a large meteorite or asteroid impact in space.; Igneous Rock - rock produced directly or indirectly from the solidification of molten magma (lava).

Meteorites have killed a cow, punched a hole in a car, been chained to the ground and thought of as a message from god. Here are some weird tales behind these space rocks up for auction in Manhattan.

Space-y Tales: The 5 Strangest Meteorites - Live Science

Chondrites are stony (non-metallic) meteorites that have not been modified due to melting or differentiation of the parent body. They are formed when various types of dust and small grains that were present in the early solar system accreted to form primitive asteroids. They are the most common type of meteorite that falls to Earth with estimates for the proportion of the total fall that they ...
